Checklist for committing anything to the repository

1. Get the latest from svn. 2. Go to $PLASMA_HOME. run "ant build test" 3. Make sure all the tests passed 4. Commit. Provide a meaningful comment, do separate commits for each feature/bug fix. 5. Check the build page http://babelfish.arc.nasa.gov/trac/europa/build to make sure your commit didn't break any of the automated builds, EUROPA is built on multiple platforms and with different variants so the fact that all tests passed on your particular platform/variant is no guarantee that it'll do the same for the others.
